Senior Developer | 1Password

Dear Hiring Manager,

My wife and I use 1Password every day, multiple times a day. We share logins with each other and with our kids. Now all of our accounts have their own strong, unique password without anyone having to remember it. It genuinely keeps our life in order. The 1Password software has given me a better peace of mind. I want to help build a product that I believe in, and use myself.

Why I think 1Password is awesome!

Building net-new self-serve experiences and evolving the systems behind Product Growth is a different kind of frontend problem than most roles ask for. The UI is the experiment, not just the delivery mechanism for one. I also like how you describe using AI internally: evaluation and human accountability built in rather than assumed. You treat it with the same rigor as security instead of chasing speed alone. Beyond the technical problem, I want to work for a company whose product I already use and believe in. 1Password is exactly that.

Why you should think I am awesome!

The last decade of my 14 years has been deep in React, the last six or so in TypeScript. That included driving company-wide adoption at Salesforce. Most of it was on customer-facing products: a high-traffic e-commerce site at Overstock, and two B2B SaaS products, Spiff and XANT. That covers both the consumer funnel and the B2B self-serve motion this role is built around. I also carry real backend experience alongside that: a Node.js and Express admin portal at Overstock, extending a Ruby service layer at Salesforce, and the full stack, React Native and Firebase, behind my own mobile game. That is the full-stack ownership your Growth systems and integrations call for. Beyond the stack, I have a repeated pattern of driving initiatives on my own and scaling them org-wide. The internationalization infrastructure I architected from scratch at Spiff is one example, the same autonomy this role is asking for.

Why we would be awesome together!

Your focus on rapid experimentation and feedback loops is something I also care about: shipping fast, evaluating the results, and learning from it. At Overstock, engineering required every deploy to go out behind an A/B flag. Each one was measured against a clear success metric, revenue impact, under the motto “do no harm.” A mobile Add to Cart flow and a rating-only review type are two changes I shipped that way. Both won on conversion, not just on my opinion of them. I would want to bring that same habit to a Growth team where speed and rigor both matter. I am based in Utah, fully remote-compatible with occasional travel, so the logistics here are simple.

Sincerely,
Travis Hoki
