Senior Frontend Engineer | Beast Industries

Dear Hiring Manager,

My son and I watch MrBeast videos together, and our whole family watched Beast Games as it aired. What I like most is what my ten-year-old takes from it. He sees someone using a massive platform to do real good for a lot of people, not just content for its own sake. Getting to help build the technology behind that, instead of just watching it, is what makes this opportunity stand out to me.

Why I think Beast Industries is awesome!

Beyond the personal connection, Beast Industries already has the thing most zero-to-one builds do not: a real audience of 100M+ people before a single line of the new frontend ships. That changes what performance and scale mean from day one. They are current numbers, not aspirational ones. Building the membership experience at that scale, with no legacy code pulling against you, is a rare combination.

Why you should think I am awesome!

I already build the way this role describes. AI coding agents are the baseline for how I ship, not an occasional shortcut. I use Claude Code and Cursor AI every day in production work at Salesforce. I also built my own AI-powered app end to end, including the prompt engineering, on my own time. Beyond that, I have spent 14 years deep in React and TypeScript, most of it owning performance, accessibility, and testing end to end rather than treating them as someone else's job. At Overstock, I brought our User Generated Content templates into ADA accessibility compliance. I also shipped changes that were A/B tested for conversion, not just opinion. At Spiff, I architected the internationalization infrastructure from scratch. I also wrote the tooling, dead-code detection, lint enforcement, that kept the whole codebase healthy as it scaled. I mentor through pairing. I authored the frontend architectural standards adopted across the entire engineering org at XANT.

Why we would be awesome together!

I like taking a problem from design through production support. I also want to keep raising the bar for the engineers around me, the way I did authoring standards at XANT. That is the kind of ownership this role is asking for. It is what I would want to bring to a team building at this scale.

One practical note: I am based in Pleasant Grove, Utah, not the Bay Area or NYC. I know this role is hybrid, two days a week in one of those offices. I do not currently plan to relocate. I am applying anyway. A build at this scale, done AI-first, does not come around often. I wanted to be in the conversation even if the location is something we would need to work out.

Sincerely,
Travis Hoki
