Senior Software Engineer, Fullstack | FanX AI

Dear Hiring Manager,

I already build the kind of product this role is asking for on my own time. My Food Cards project integrates the Anthropic Claude API so users can search a catalog in plain English. Prompt engineering and schema-validated output make sure an ambiguous answer degrades gracefully instead of breaking the app. That is the same discipline I would bring to shaping AI-powered features here: ship something that feels intuitive, and make sure it fails safely when it does not.

Why I think FanX AI is awesome!

Leading frontend technical strategy with generative AI at the center, rather than bolted on after the fact, is a rare mandate. Most companies treat AI as a single feature, not an architectural decision. Getting to shape that direction from the frontend side, together with design and product, is exactly the kind of ownership I look for at this stage of my career.

Why you should think I am awesome!

I have spent the last decade deep in React, the last six or so in TypeScript, most of it on customer-facing products. I also bring real design sensibility to that work. I started college with a Gaming & Animation emphasis before switching to Web Development, and I still illustrate and edit video on my own time. At Overstock, I brought our User Generated Content templates into ADA accessibility compliance and rebuilt pages for responsive, cross-device use. I mentor through pairing, and I authored the frontend architectural standards adopted across the whole engineering org at XANT.

Why we would be awesome together!

I already use Claude Code and Cursor AI every day in production work. Advancing a frontend stack around generative AI would not be a new habit for me, it is already how I ship. I also want to keep mentoring. Authoring standards and pairing with other engineers has been the most satisfying part of my last few roles, and this position asks for exactly that kind of technical leadership.

Sincerely,

Travis Hoki
