Design Engineer | GC AI

Dear Hiring Manager,

I bridge design and engineering in a way most frontend engineers cannot. I started college with a Gaming & Animation emphasis before switching to Web Development, and I still illustrate on my own time. That combination, someone who thinks visually and ships production code, is exactly what a Design Engineer role is asking for, and it is rare to find in one person.

Why I think GC AI is awesome!

Making sophisticated legal work feel simple is a real design problem, not just a UI polish problem. A detail like Exact Quote, tying every AI statement to a verifiable citation, is a genuinely hard interface challenge. It means showing a source inline without breaking the reading flow, and making trust feel built in rather than an extra step. I also want to be working at the edge of what AI can actually do right now, not just wrapping a UI around it after the fact. A feature like that is exactly where interface design and model behavior meet.

Why you should think I am awesome!

I have 14 years of expert-level React, TypeScript, HTML, and CSS, and real accessibility experience. I brought Overstock's User Generated Content templates into ADA compliance. I have worked extensively with Storybook and component-driven design systems, and I bring systems-building experience beyond that too. I architected internationalization infrastructure from scratch at Spiff, and I wrote the tooling, dead-code detection, lint enforcement, that became a team-wide standard. I also bring real B2B SaaS experience, Spiff and XANT, and I have designed and built marketing sites end to end, including the brand and storefront for a company I founded myself. I mentor through pairing, and I authored the frontend architectural standards adopted across the whole engineering org at XANT.

Why we would be awesome together!

I like ambiguity and ownership more than I like structure for its own sake. Joining Spiff as an early engineer and building platform infrastructure from scratch, through to acquisition, is exactly that kind of work. One honest note: my animation experience comes from building a physics-driven mobile game and from formal animation coursework, not from shipping interface micro-interactions specifically. The instincts transfer, motion with purpose, timing, easing, but I want to be upfront that it is adjacent experience, not a direct match.

Sincerely,
Travis Hoki
