Senior Full Stack Engineer I (React, Node.js) | Linus Health

Dear Hiring Manager,

Your posting asks for AI-assisted development paired with validation, not just speed for its own sake. That is exactly the discipline behind my Food Cards project. It enforces schema-validated output on every LLM response, so a fast answer never comes at the cost of a broken or misleading one. I want to bring that same instinct to a company whose product involves real clinical stakes.

Why I think Linus Health is awesome!

Brain health is not a space where you can ship fast and fix it later. Getting the interface and the API layer right the first time matters more here than in most software. That is a real engineering discipline problem, not just a mission statement. I like the idea of that higher bar being part of the actual day-to-day work, not just a value on a slide.

Why you should think I am awesome!

I have 14 years in React, with deep, current experience across Webpack, Vite, ESLint, Jest, and Cypress. I also bring real Node.js experience building RESTful services and server-side rendering, at Overstock and Chatbooks. I have shipped production React Native work too. I designed, illustrated, and built a mobile game published on the Apple App Store and Google Play Store. I mentor through pairing, and I authored the frontend architectural standards adopted across the whole engineering org at XANT.

Why we would be awesome together!

One honest note: my Node.js experience is real but secondary to my frontend work, not a dedicated backend track record. I also have no background in digital health or regulated data environments like HIPAA. What I do have is a career of switching industries and stacks and picking up what I needed each time. I would rather say that plainly than oversell it.

Sincerely,

Travis Hoki
