Senior Software Engineer, Front-end - D&I Solutions | Planet

Dear Hiring Manager,

Using satellite data to help life on Earth, not just to sell more of something, is a mission I would be glad to build for. I do not have a background in geospatial technology or the defense and intelligence sector specifically. I want to be upfront about that before anything else. What I do have is 14 years of frontend engineering and a habit of learning a new domain fast.

Why I think Planet is awesome!

A tool that gives customers daily, near-real-time insight into places that matter to them is a real product, not just a dashboard of numbers. Getting the frontend right there, fast, trustworthy, clear at a glance, is a genuinely interesting design and engineering problem. That is true regardless of what the underlying data is measuring.

Why you should think I am awesome!

I have 14 years in React and TypeScript, with real depth in REST API integration and state management through Redux. I have led feature work from discovery through deployment repeatedly. I mentor through pairing and code review, and I authored the frontend architectural standards adopted across the whole engineering org at XANT. I also architected internationalization infrastructure from scratch at Spiff. I use Claude Code and Cursor AI every day in production work, not to look busy but because it is genuinely how I ship faster.

Why we would be awesome together!

One honest note: I have never worked with mapping libraries, geospatial data, or in the defense and intelligence sector. What I do have is a career of switching industries and stacks, retail, consumer product, sales tech, SaaS, and picking up what I needed each time. I would rather say that plainly than pretend otherwise.

Sincerely,
Travis Hoki
