Senior Frontend Engineer | Re:Build

Dear Hiring Manager,

Your posting names agentic coding tools like Cursor and Claude as an expected part of the daily workflow. That already describes how I work. I use Cursor AI and Claude Code every day in production at Salesforce, not to look busy but because it is genuinely how I ship faster. I am drawn to Reflow specifically because replacing spreadsheets and status meetings with real structured tooling is exactly the kind of problem I like working on. It is the kind that changes how a team actually works, not just how it looks.

Why I think Re:Build is awesome!

Re:Build's mission is bringing important manufacturing back to America and creating meaningful jobs in places that lost them. That is something I would be proud to support, not just work adjacent to. Your posting describes the damage that comes from a missed change request or context that never reaches the right person. I do not know the hardware side of that problem myself, but I recognize it as a coordination failure, and coordination failures are exactly the kind of thing good software fixes. Building the interface layer for that, requirements, dependencies, project health, across disciplines that do not naturally talk to each other, is a real, substantial frontend architecture problem, not just a dashboard. That is what makes this interesting to me, not just the ground-floor opportunity itself.

Why you should think I am awesome!

I have 14 years in React and TypeScript. I also have real, extensive experience with Storybook and component-driven development. I use Vite and Cypress in my current stack. I have also shipped a structured-AI-output feature myself. My Food Cards project resolves natural-language queries into schema-validated filters, so an ambiguous model response degrades gracefully instead of breaking the UI. That is the same discipline your AI-generated summaries and deliverables would need. Beyond the stack, I have led architecture and standards repeatedly: internationalization infrastructure from scratch at Spiff, company-wide TypeScript adoption at Salesforce, and the frontend standards adopted across the whole engineering org at XANT.

Why we would be awesome together!

I joined Spiff as an early engineer and built platform infrastructure from scratch through its acquisition, the same ground-floor pattern this role is asking for. One honest note: I do not have hardware or engineering-workflow domain experience specifically. What I do have is a career of switching industries and stacks, retail, consumer product, sales tech, SaaS, and picking up what I needed each time. I would bring that same ramp speed here.

Sincerely,
Travis Hoki
