Sr. Software Developer: Front-End | Infotech

Dear Hiring Manager,

Your posting lists AI-first, agentic development as an expert-level requirement, not an extra. I have been pairing daily with Claude Code and Cursor AI in production work at Salesforce, on refactors, debugging, and test-coverage work, since well before most teams treated it as standard practice.

Why I think Infotech is awesome!

Infotech's software sits behind digital bidding and inspection for the large majority of state transportation agencies in the country. That kind of stakes changes how I think about the work. A flaky test suite or an inaccessible form is not a minor bug here; it can stall a real infrastructure project. I want the software I build to matter past a sprint board, so I build CI pipelines that catch regressions before they ship, and I test accessibility with an actual screen reader, not just an automated audit.

Why you should think I am awesome!

I bring 14 years of frontend depth in React, TypeScript, and JavaScript, with accessibility work that went past checkbox compliance. At Overstock I brought ratings, reviews, customer photos, and Q&A templates for a high-traffic national e-commerce site into ADA accessibility compliance. I have also driven CI/CD and code-quality standards from the inside: expanding Jest coverage and establishing strict ESLint rule sets at Salesforce that drove company-wide TypeScript adoption.

Why we would be awesome together!

One honest note: my professional depth is in React, not Vue, though your own skills matrix marks React as transferable. I have swapped frameworks and stacks throughout my career without missing a step, from AngularJS to React at Chatbooks, from PHP and WordPress to modern JS elsewhere, and I would bring that same adaptability here.

Sincerely,
Travis Hoki
